OSPF

Open shortest path first
Link state routing protocol
open standard
metric = Cost ---- Interface bandwidth

cost = $\frac{10^8}{\text{bandwidth in bits}}$

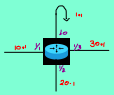

Router ID

manually assign by admin

highest IP in Loop back int

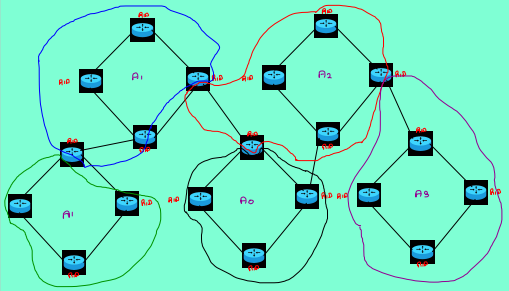

highest IP in Physical int

IP x.x.x.x

Area ID :-

Group

WCB

wild card Bits ⟶ matching

0 - care

1 - dont care

Process ID

Number Same / Different

RIP$_2$ - 224.0.0.9

EIGRP - 224.0.0.10

Sending Hello Packet

Hello — SIP: Exit int IP
DIP: 224.0.0.5 → OSPF multicast IP

Neighbor condition

- Same N/w
- Same Area
- Unique Router ID
- Same time

OSPF timer

Hello time = 10 Sec

Dead time = 4×4 = 40 Sec

$$\text{Cost} = \frac{10^8}{\text{bw in bits}}$$

$$= \frac{10^8}{10{,}000 \times 1000}$$

$$= 10$$
